Rental Car Fuel Depot – Manchester Airport

A multinational rental car company was looking for opportunities to streamline part of its UK business and opened up discussions with CTSL to investigate the viability of installing and operating a fuel storage and filling depot at Manchester Airport to serve their extensive and busy fleet of rental cars. As the fuels to be handled included both petrol and diesel, CTSL partnered with another specialist contractor, who dealt with the petrol distribution element of the project.

As well as designing and building the above ground bunded petrol and diesel tanks, CTSL designed and built the delivery point and metered fuel take-off system and arranged for the installation and commissioning of the entire system.

Plant and attachment repair

CTSL frequently undertake repairs and related fabrication commissions for operators of earthworks plant and equipment.

These commissions range from repairs to conventional blades and excavator buckets to the fabrication of bespoke attachments for specialised applications.

Portal Frame Buildings

CTSL are experienced in the fabrication of steel portal-frame buildings. Buildings can either be supplied in component form for others to erect or CTSL will undertake the erection and assembly at the client's site.

CTSL can also undertake the elements of the construction including site clearance, earthworks, landscaping and reduced-level excavations, the construction of foundations, the design and installation of services and drainage and the casting of ground floor slabs and construction of car parks and other areas of hardstanding.

MITechnologies

MITechnologies – installed fuel lines, built small tank, on going serving – leak detection high spec auto research facility

Fitting biggest single panel door in Europe
